FirstCull™

Early assessment of file types, email headers and deNISTing

XPRIORI

FirstCull ECA and Smart-Analysis Tool

FirstCull is an early case assessment (ECA) and smart-analysis tool designed to analyze unstructured information. The solution is simple - an easy to use application that runs on any computer and automatically performs in-depth examinations of millions of files, directories and their contents.

Here is how it works - Point FirstCull to the files you want to analyze; the program automatically scans and assesses that data (from hard drives, entire computers, servers, removable media, whole networks, etc.) and then generates a series of easy to read reports that categorically detail the key attributes about that information.

Use FirstCull in all stages of eDiscovery, early case assessment, culling, denisting, compliance, litigation readiness, forensics, records retention, email assessment and a whole lot more. Start smart by using FirstCull for Early Case Assessment.

FirstCull Process

1) START FirstCull and name your project...

2) Point to the directories you wish to analyze...

3) Configure desired settings using the WIZARD...

4) FirstCull begins "SMART" analysis of your data...

5) Reports are generated for review and assessment ...

6) Enjoy useful reports from your analysis...

FirstCull Features

FirstCull deploys a fully automated feature set. It performs multi-faceted analyses of unstructured information. FirstCull:

- Identifies and reports the number of files present in the data set
- Categorizes and numbers files according to extension type, source and custodian
- Identifies all e-mail messages from PST and Lotus NSF files
- Analyzes e-mail attachment files
- Identifies and reports files that will require optical character recognition (OCR)
- Automatically assesses contents of most commonly user container files
- Operates without user intervention
- Deploys a user friendly interface

FirstCull makes it easy to understand the makeup of a data set. Once the details of that information are assessed, users can better decide what unstructured information to process; whether loading it to a discovery and review tool, into a general content management system or some other system.

Feature	Lite	Professional	Enterprise
